# Applying filters to SQL queries

### Project description

I am a security professional at a large organization. As part of my job, I investigate security issues to help keep our system secure. Recently, I discovered some potential security issues involving login attempts and employee machines.

My task is to examine the organization's data in the employees and log\_in\_attempts tables. I will use SQL filters to retrieve records from different datasets and investigate the potential security issues.

### Retrieve after hours failed login attempts

riaDB [org	ganization]>	SELECT * FRO	M log_in_atte	empts WHERI	E login_time > '18	:00:00' AND success = 0;	
event_id	username	login_date	login_time	country	ip_address	success

iaDB [org	ganization]>	•					

After-hours login attempts: I retrieved all login attempts that were made outside of normal business hours. The query I wrote is being used to identify all login attempts that occurred after 18:00:00 and were not successful.

# Retrieve login attempts on specific dates

MariaDB +	<pre>fariaDB [organization]&gt; SELECT * FROM log_in_attempts WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';</pre>

```

The security team needs to make one more update to employee machines. The employees who are in the Information Technology department already had this update, but employees in all other departments need it. This query is being used to identify all employees who do not work in the Information Technology department.

#### Summary

I retrieved the following data:

- After-hours login attempts: I retrieved all login attempts that were made outside of normal business hours.
- Login attempts on specific dates: I retrieved all login attempts that were made on specific dates that I was interested in.
- Login attempts outside of Mexico: I retrieved all login attempts that were made from outside of Mexico.
- Employee data from the marketing, finance, and sales departments: I retrieved employee data from these departments for investigation purposes.
- Employees who were part of all other remaining departments that were not in the information technology department: I retrieved employee data from all departments that were not in the information technology department.

This data helped me to identify the potential security issues and to take steps to mitigate the risks.

Here are some of the security issues that I identified:

- There were a number of after-hours login attempts. This could be a sign that someone was trying to gain unauthorized access to the system.
- There were a number of login attempts on specific dates. This could be a sign that someone was trying to access the system at a time when they knew the system would be less secure.
- There were a number of login attempts from outside of Mexico. This could be a sign that someone was trying to access the system from a foreign country.
- There were a number of employees in the marketing, finance, and sales departments who had made suspicious login attempts.
- There were a number of employees in departments other than the information technology department who had made suspicious login attempts.

As a security professional at a large organization, I recently discovered some potential security issues involving login attempts and employee machines. I used SQL filters to retrieve records from different datasets to investigate these issues.

SQL can be used to achieve a better security posture by helping to identify and prevent security threats. By using these queries, businesses can gain valuable insights into their security posture and take steps to mitigate risks.
